

# Assignment1: Project Repository Setup

*Objective:* Setup your project repository and perform basic research.

Learn about and customize your repository by doing the following:

1. Create a GitHub repository.
2. Send me the GitHub repository URL via Piazza.
3. Modify the readme part of your repository to describe the nature of your repository.
4. Customize the “issues” by specializing them, such as the types and colors of tags.
5. Create issues and assign them to the appropriate persons (may be yourself).
6. Create a page to document the following **research** you will perform:
  - Study git as a version management system. There are many guides and videos you can watch. I recommend Git For Ages 4 And Up (<https://youtu.be/1ffBJ4sVUb4>). It is long, but very good. However, you can choose a different resource if you prefer.
  - Examine Wikidata (<https://www.wikidata.org>). Find an API and perform some tests. Document what you learned on the research section of your Github repository.

## Notes:

- You must document using the wiki system and not upload external document.
- Keeping your project repository up to date is a task of constant gardening. You must keep it up to date on regular basis.
